

Blocky4Backup

Maximum protection against ransomware through WORM technology for your backup

What is Blocky?

A Software product suite that protects your data against ransomware.

„Your Last Line of Defense“.

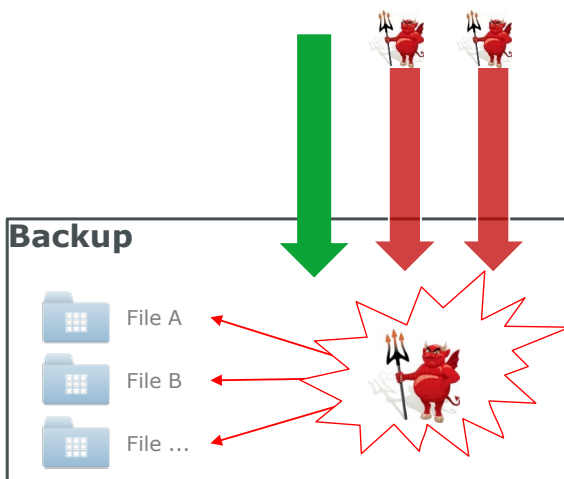

What does Blocky do?

Blocky takes a fingerprint of each program process. If a Malware attack is attempted, it will be blocked due to non-matching fingerprints.

Why do you need Blocky?

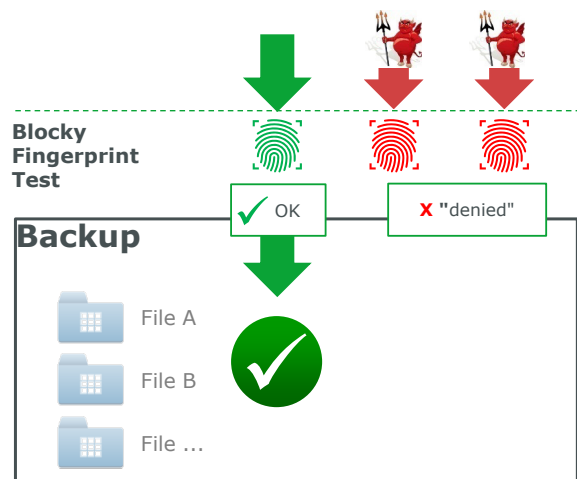

Common protection procedures are patchy. Blocky will protect against malware even if a virus has entered the program and damaged the Blocky software.

Regular Backup Systems

- Ransomware can enter the Backup and encrypt/delete the Backup data.
- The user has no more possibility to access the modified data.
- Attack by Ransomware
- Access by regular process

Backup with Blocky4Backup

- The Backup is protected via a unique fingerprint method so only the certified application can modify data.
- The Backup data - now safe from Ransomware modifications - will always be available in case of a successful attack of the Live System.
